

# 網際網路

### 呼叫Web API - GET

```
<?php
$url = "https://url.com";
$html = file_get_contents($url);
echo $html;
?>
```

#### 顯示圖片

```
<?php
$url = "https://hostname/image.jpg";
$data = file_get_contents($url);
header('content-type: image/jpeg');
echo $data;
?>
```

## 以img標籤顯示圖片

```
<?php
$url = "https://hostname/image.jpg";
                                               得到 image/jpeg
$data = file_get_contents($url);
$mime_type = (new finfo(FILEINFO_MIME_TYPE))->buffer($data);
$imageData = base64_encode($data);
$src = "data: $mime_type;base64,$imageData";
?>
<html>
<body>
<img src="<?= $src ?>" width="400">
</body>
</html>
```

#### JSON 解析

```
<?php
$str = '{"name": "David", "age": 30}';

$json0bj = json_decode($str, true);
print_r($json0bj);
?>
```

```
Array
(
     [name] => David
     [age] => 30
)
```

```
<?php
$api_key = getenv("OPENAI_API_KEY");
$data = '{
  "model": "gpt-3.5-turbo",
  "messages": [
    {"role": "user", "content": "為什麼會有地震?"}
}';
$opts = array('http' =>
  array(
    'method' => 'POST',
    'header' => "Content-Type:application/json\r\nAuthorization:Bearer {$api_key}\r\n",
    'content' => $data
$context = stream_context_create($opts);
$result = file_get_contents('https://api.openai.com/v1/chat/completions', false, $context);
echo json_decode($result, true)['choices'][0]['message']['content'] . "\n";
```

# POST 的資料為 key-vale 格式

- 若傳送的資料為 x=10&y=20 這樣的格式,有兩種寫法
- 寫法一

■ 寫法二

d = x=10&y=20

#### Web API 設計

- 取得 http request 的呼叫方式,例如 get 或 post
- 建議安裝 postman 軟體 https://www.postman.com

```
<?php
$method = $_SERVER['REQUEST_METHOD'];
echo $method;
?>
```

#### RESTful API

```
<?php
$method = $_SERVER['REQUEST_METHOD'];
switch ($method) {
case 'GET':
   $sql = 'select';
   break;
case 'POST':
   $sql = 'insert into';
   break;
case 'PUT':
   $sql = 'update';
   break;
case 'DELETE':
   $sql = 'delete';
   break;
default:
   $sql = 'unknown';
```

#### .htaccess

```
<IfModule mod_rewrite.c>
    RewriteEngine On
    RewriteCond %{REQUEST_FILENAME} !-f
    RewriteCond %{REQUEST_FILENAME} !-d
    RewriteRule ^(.*)$ index.php [L]
</IfModule>
```

#### index.php

```
<?php
$uri = $_SERVER["REQUEST_URI"];
var_dump($uri);
echo "<hr>";
$str = match($uri) {
    "/proj/a" => "AAA",
    "/proj/b" => "BBB",
    default => "default"
};
echo $str;
?>
```
